Dr. Luis Enrique Amaya Sanchez- Falsified test in Hospital Angeles Pedregal:

Narendra
Jana

Thought the LP test that the doctor does is directed to be falsified by the United States by the hospital, Dr. Amaya ignored the LP test because he understands that falsifying LP tests with surrounding diagnostics and MRI series that shows clear disease pathology is unrealistic, especially in what is eventually shown to be a progressive neurodegenerative condition. Prior to this Dr. Amaya gave plasmapheresis to treat the condition.

CSF proteins should be high due to seizures.
 CSF glucose should be high due to what was then gross inflammation in the spinal column (secondary progressive MS).

The IGG ratings would have to be higher due to MS.

PATIENT INFORMATION
JANA X, NARENDRA NIRMAL

REPORT STATUS **Final**

ORDERING PHYSICIAN

CLIENT INFORMATION
53350
HOSPITAL ANGELES DEL PEDREGAL
CAM. A STA. TERESA NO. 1055
COL. HEROES DE PADERNA
MEXICO D.F. 10700.

DOB: 10/27/1984 Age: 33
SEX: M

COLLECTED: 10/23/2018 00:00
RECEIVED: 10/25/2018 19:49
REPORTED: 11/01/2018 17:44

COMMENTS: AGE 34 YEARS OLD, 2.0 ML SERUM + 3.0 ML CSF REFRIGERATED.

Test Name	In Range	Out of Range	Reference Range	Lab
Myelin Basic Protein		<2.0 L	2.0-4.0 mcg/L	EZ

MBP Result: Interpretation
2.0-4.0 mcg/L Negative
4.1-6.0 mcg/L Weakly Positive
>6.0 mcg/L Positive

This test was developed and its analytical performance characteristics have been determined by Quest Diagnostics Nichols Institute San Juan Capistrano. It has not been cleared or approved by FDA. This assay has been validated pursuant to the CLIA regulations and is used for clinical purposes.

Oligoclonal Bands, IgG
Oligoclonal Bands (IgG), CSF NO BANDS NO BANDS
No oligoclonal bands were identified in this patient's CSF when compared to their corresponding serum sample.

Oligoclonal bands are present in the CSF of more than 85% of patients with clinically definite multiple sclerosis (MS). To distinguish between oligoclonal bands in the CSF due to a peripheral gammopathy and oligoclonal bands due to local production in the CNS, serum and CSF should be tested simultaneously. Oligoclonal bands can however be observed in a variety of other diseases, e.g., subacute sclerosing panencephalitis, inflammatory polyneuropathy, CNS lupus, and brain tumors and infections. The clinical significance of a numerical band count, determined by isoelectric focusing, has not been definitively defined. The data should be interpreted in conjunction with all pertinent clinical and laboratory data for this patient.

IGG SYNTHESIS RATE			
Synthesis Rate IgG, CSF	-4.1	-9.9 TO +3.3 mg/24 h	EZ
IgG Index, CSF	0.42	<0.66	
Albumin, CSF	17.6	8.0-42.0 mg/dL	
IgG, CSF	1.4	0.8-7.7 mg/dL	
Immunoglobulin G	932	694-1618 mg/dL	
Albumin, Serum	4.9	3.5-5.2 g/dL	

The IgG Synthesis rate, CSF and IgG Index, CSF are two formulas for estimating the amount of IgG produced in the central nervous system. Evidence of increased synthesis of IgG provides support for the diagnosis of multiple sclerosis.

JANA X, NARENDRA NIRMAL - 87027356 Page 1 - Continued on Page 2

The "myelin basic protein" is falsified due to the presence of gross lesions in the cervical spine and what was then progressive optic neuropathy.
The Oligoclonal Bands are falsified due to prominent optic neuropathy.
The IGG synthesis rate is falsified also due to the progressive nature of MS (the condition was persistent then).

This is the last LP (lumbar puncture) test that was falsified for the sake of perpetuating medical negligence or for the sake of mis-typifying MS.
