Na renAugust 9th and 24th Nucleo Radioloico Avanzado, Tijuana Mexico:

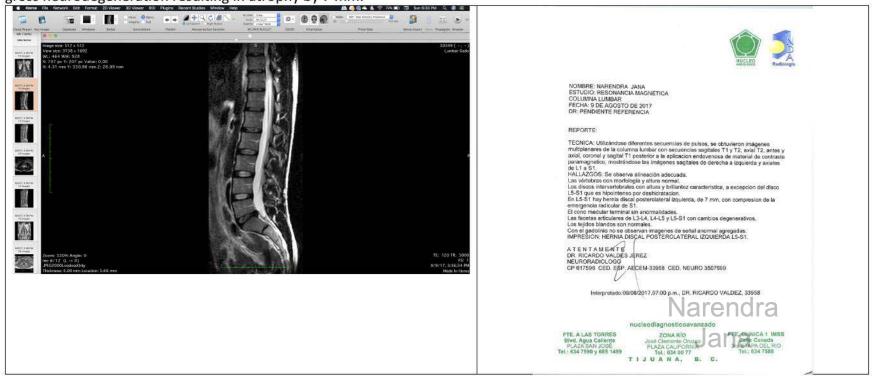

Janawo MRIs are done in Nucleo Radioloico Avanzado in August 2017.

First of the Lumbar in August 9th and the second of the Thorasic in August 24th.

The Lumbar MRI shows gross neurodegeneration.

By January 2010 it was already clear that the US was instructing foreign nations to falsify radiological reports of MRI data (with a video recording of the radiologist erasing the MRI data) or to erase MRI data that shows medical pathology.

The neurodegeneration is extensive from already long term MS, from lumbar column L3 to L5 down to sacral spine S1. S1 shows gross neurodegeneration resulting in atrophy by 7 mm.

By peculiarity ignoring all other medical pathologies, the US appears to be keen on specifically not acknowledging the disease pathology around Multiple Sclerosis so they instruct radiologists in foreign nations to not mention lesions or neurodegeneration. They often highlight it in MRI reports though its clearly contrary to the data in the MRI series.

Narenso foreign nations do not mention the disease pathology that causes the neurodegenerative condition, Multiple Sclerosis, like in Riga, Latvia in January 10th 2017 (The MRI video of which demonstrates criminal fraudulence in diagnostics).

But though the radiologists don't mention it the clinicians in foreign nations readily identify the lesions and the progression of the condition with ease and give the appropriate recommendations for the medications (medications which are then restricted from being purchased by the US through denial by US physicians).
